the interest in the mathematical modeling of transportation systems stems from the need to predict how people might make use of new or improved transport infrastructure in order to evaluate the benefit of the required investments to this end it is necessary to build models of the demand for transportation and models that determine the way in which people who travel use the transportation network if such models may be constructed and their validity reasonably assured then the prediction of the traffic flows on future and present transportation links may be carried out by simulating future situations and then evaluating the potential benefits of alternative improvement projects in the attempts that were made to construct mathematical models of transportation networks the notion of equilibrium plays a central role suppose that the demand for transportation that is the number of trips that occur between the various origins and destinations is known then it is necessary to determine how these trips are attracted to the alternative routes available between origins and destinations knight 1924 gave a simple and intuitively clear description of the behaviour of road traffic under conditions of congestion
